## Architecture section:

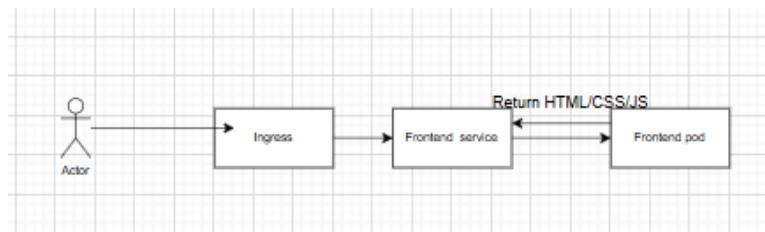

### High-level architecture diagram or description:

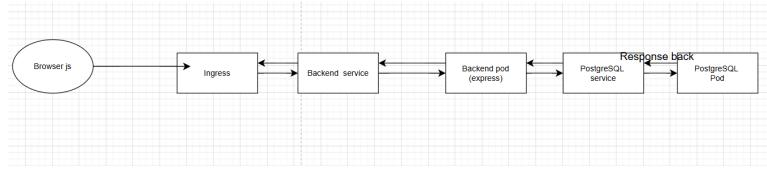

## name space organization:

## user flow:

## network flow:

## API Endpoints Section

Complete list of all API endpoints:

Endpoint	Method	Purpose	Request Body
/api/employee	GET	Get all employee	None
/api/employee/:id	GET	Get one employee	None
/api/employee	POST	Create one employee	need data to create
/api/employee/:id	PATCH	Update employee	need data to update
/api/employee/:id	DELETE	Delete employee	none
/api/health	GET	Health check	none

**api example:**

The screenshot shows a REST client interface with the following details:

- Method:** DELETE
- URL:** myapp.example.com/api/employee/4
- Status:** 200 OK
- Time:** 35 ms
- Size:** 349 B
- Description:** Employee deleted successfully
- Body:** JSON response (x-www-form-urlencoded)

Key	Value	Description
		Bulk Edit

```
1 {  
2   "message": "Employee deleted successfully",  
3   "deleted": {  
4     "id": 4,  
5     "firstName": "Bishesna",  
6     "lastName": "shahi"  
7   }  
8 }
```

GET myapp.example.com/api/employee Send

Docs Params Auth Headers (8) Body Scripts Settings Cookies

x-www-form-urlencoded

	Key	Value	Description	...	Bulk Edit
Body	200 OK	16 ms 1.65 KB	Save Response	...

22     "salary": "2342377.00",

23     "address": "kathmandu",

...     -----

The screenshot shows the Postman application interface. At the top, there's a header with 'HTTP' and 'New Collection / New Request'. To the right are 'Save' and 'Share' buttons. Below the header, a search bar contains 'myapp.example.com/api/employee/4'. To the right of the search bar is a 'Send' button. Underneath the search bar, there are tabs for 'Docs', 'Params', 'Auth', 'Headers (8)', 'Body' (which is selected), 'Scripts', 'Settings', and 'Cookies'. The 'Body' tab has a dropdown set to 'x-www-form-urlencoded'. Below this is a table with columns 'Key', 'Value', 'Description', and 'Bulk Edit'. A 'Body' dropdown shows '200 OK'. At the bottom of the interface, there are buttons for 'JSON', 'Preview', 'Visualize', and other tools.

```
1 {  
2   "id": 4,  
3   "firstName": "Bishesna",  
4   "lastName": "shahi",  
5   "email": "bishesnas@gmail.com",  
6   "contactNumber": "9841367751",  
7   "salary": "234234.00",  
8   "address": "kathmandu",  
9   "dob": "2026-02-06",  
10  "age": 0,  
11  "imageUrl": "https://via.placeholder.com/221",  
12  "createdAt": "2026-01-06T08:49:27.256Z",  
13  "updatedAt": "2026-01-07T10:58:36.485Z"  
14 }
```

## Deployment Instructions:

### prerequisite:

- Docker desktop: enable Kubernetes
- helm

How Directory is maintained:

```
assignment  
|____backend
```

```
|   |   packages
|   |   script.js
|   |   DockerFile
|   Frontend
|       DockerFile
|       index.html
|       style.css
|       index.js

|   Kubernetes
|       configmap.yaml
|       deployment-b.yaml
|       deployemnt.yaml
|       service_backend.yaml
|       service_frontend.yaml
|       secret-b.yaml
|       ingress-b.yaml
|       ingress.yaml
|       values.yaml
|       Readme.md
```

## Image creation

To create a docker file for frontend you must be inside the Frontend folder where Dockerfile for frontend. here i build image of some-content-nginx

docker build -t <nameofimage> .

```
docker build -t some-content-nginx .
```

To create a docker file for backend you must be inside the Backend folder where Dockerfile for Backend. here I build image of node-backend.

```
docker build -t node-backend .
```

## now lets deploy first Database:

I used helm values for postgres:

```
helm repo add bitnami https://charts.bitnami.com/bitnami
```

```
helm install my-postgresql bitnami/postgresql --version 18.2.0 --values value  
s.yaml
```

```
helm upgrade --install my-postgresql bitnami/postgresql --version 18.2.0 --val  
ues values.yaml
```

now to create Database, user and tables:

go to the running pod of postgres:

```
kubectl exec -it podname -n database -- bash
```

```
psql --host my-postgresql -U postgres -d postgres -p 5432
```

for password:

```
kubectl get secret my-postgresql -n database  
-o jsonpath="{.data.postgres-password}" | base64 --decode
```

Inside the Database:

```
psql --host my-postgresql -U myapp_user -d myapp_db -p 5432
```

```
CREATE DATABASE myapp_db;  
CREATE USER myapp_user WITH PASSWORD 'mynewpassword';  
GRANT ALL PRIVILEGES ON DATABASE myapp_db TO myapp_user;
```

to create employees table

```
CREATE TABLE employees (  
    id SERIAL PRIMARY KEY,  
    first_name VARCHAR(100) NOT NULL,  
    last_name VARCHAR(100) NOT NULL,  
    email VARCHAR(255) UNIQUE NOT NULL,  
    contact_number VARCHAR(20) NOT NULL,  
    salary NUMERIC(10, 2) NOT NULL,  
    address TEXT NOT NULL,  
    dob DATE NOT NULL,  
    age INTEGER,  
    image_url TEXT,  
    created_at TIMESTAMP DEFAULT CURRENT_TIMESTAMP,  
    updated_at TIMESTAMP DEFAULT CURRENT_TIMESTAMP  
);
```

```
GRANT ALL PRIVILEGES ON TABLE employees TO myapp_user;  
GRANT USAGE, SELECT ON SEQUENCE employees_id_seq TO myapp_user;
```

check if they are applied:

```
kubectl get pods
```

```
kubectl get secrets
```

```
kubectl get pv
```

```
kubectl get pvc
```

To connect with pgadmin 4

```
kubectl port-forward svc/<svc_name> 5432:5432
```

---

apply ingress:

```
kubectl apply -f https://raw.githubusercontent.com/kubernetes/ingress-nginx/controller-v1.10.1/deploy/static/provider/cloud/deploy.yaml
```

```
kubectl get ns
```

see if there is ns ingress-nginx

```
kubect get pods -n ingress-nginx
```

Now lets deploy backend:

```
kubectl create ns backend
```

```
kubectl apply deployment-b.yaml -n backend
```

```
kubectl apply service_backend.yaml -n backend
```

```
kubectl apply ingress-b.yaml -n backend
```

```
kubectl apply secret-b.yaml -n backend
```

```
kubectl apply configmap.yaml -n backend
```

to see if it is all applied:

```
kubectl get pods -n backend
```

```
kubectl get svc -n backend
```

```
kubectl get secrets -n backend
```

```
kubectl get configmap -n backend
```

```
kubectl get ingress -n backend
```

check if pods are creates

---

now lets deploy frontend:

```
kubectl create ns frontend
```

```
kubectl apply service_frontend.yaml -n frontend
```

```
kubectl apply deployment.yaml -n frontend
```

```
kubectl apply ingress.yaml -n frontend
```

check is it is applied:

```
kubectl get ingress -n frontend
```

```
kubectl get pods -n frontend
```

```
kubectl get svc -n frontend
```

## replica analysis:

```
kubectl scale deployment backend --replicas=2 -n backend
```

```
PS C:\Users\acer\OneDrive\Desktop\New folder\assessment> kubectl get pods -w -n backend
NAME           READY   STATUS    RESTARTS   AGE
backend-7b485b9dbb-5x6t2  1/1     Running   0          2m5s
backend-7b485b9dbb-dlpx7  1/1     Running   1 (67m ago)  150m
```

### In 2 replica scenario:

- first task is sent to first pod
- and send task is sent to second pod

In this scenario, I added a new employee so one pod is responsible to add a new employ to database but we also need to fetch instantly. so another pod has less load, the request is sent to it.

```
PS C:\Users\acer\OneDrive\Desktop\New folder\assessment> kubectl logs -n backend  
-f backend-7b485b9dbb-5x6t2  
  
> assesment@1.0.0 start  
> node script.js  
  
[dotenv@17.2.3] injecting env (0) from .env -- tip: ⚙ enable debug logging with  
{ debug: true }  
Server started at http://localhost:8000  
Database: myapp_db@my-postgresql.default.svc.cluster.local:5432  
✓ Database connected successfully  
🗑 Deleting employee ID: 2  
🗑 Deleting employee ID: 6  
✓ Deleted employee ID: 6  
✓ Fetched 4 employees  
✓ Fetched 3 employees
```

```
PS C:\Users\acer\OneDrive\Desktop\New folder\assessment> kubectl logs backend-7b485b9dbb-dlpzx7 -n backend -f  
🗑 Deleting employee ID: 2  
✓ Deleted employee ID: 2  
✓ Fetched 5 employees  
✓ Fetched employee ID: 4  
🗑 Deleting employee ID: 4  
✓ Deleted employee ID: 4  
✓ Fetched 4 employees  
✓ Fetched 3 employees  
📄 Creating employee: {  
  firstName: 'Bishesna',  
  lastName: 'Shahi',  
  email: 'bishesnas23@gmail.com'  
}  
✓ Created employee ID: 31  
🗑 Deleting employee ID: 31  
✓ Deleted employee ID: 31
```

In scenario of 4:

I sent a first request of creating a user. pod 1 handled the request, it created an employee. After the user is created, it needs to be fetched so the pod 2 handles it. Now when i sent a request to edit the pod, pod 3 handles the request as it has less request and then to fetch the data pod 4 takes the request.

```

PS C:\Users\acer\OneDrive\Desktop\New folder\assessment> kubectl logs -n backend -f backend-7b485b9ddb-5x6t2
00
Database: myapp_db@my-postgresql.default.svc.cluster.local:5432
✓ Database connected successfully
✗ Deleting employee ID: 2
✗ Deleting employee ID: 6
✓ Deleted employee ID: 6
✓ Fetched 4 employees
✓ Fetched 3 employees
✖ Creating employee: {
  firstName: 'Bishesna',
  lastName: 'Shahi',
  email: 'bishesnas23@gmail.com'
}
✓ Created employee ID: 31

PS C:\Users\acer\OneDrive\Desktop\New folder\assessment> kubectl logs -n backend -f backend-7b485b9ddb-1vrrr
> assesment@1.0.0 start
> node script.js

[dotenv@17.2.3] injecting env () from .env -- tip: ✅ write to custom object with { processEnv: myObject }

PS C:\Users\acer\OneDrive\Desktop\New folder\assessment\kubernetes> kubectl get pods -n backend -w
```

## Frontend:

The screenshot shows a web application interface for managing an employee database. The left side features a sidebar with navigation links: Home, Employees, Departments, and Help. Below these are sections for 'Employee List' and 'Employee Information'. The 'Employee List' section contains five entries, each with a 'Delete' button. The 'Employee Information' section is currently empty.

**we can see the changed data**

A screenshot of the "Employee Database Management" application. The "Employee List" section on the left shows the same list of employees as before. The "Employee Information" section on the right is now focused on "Alisa Dangol". It displays her name, a placeholder "Employee Photo" (a large empty circle), her email address (alison@gmail.com), and her contact number (9847342888). The "Edit Employee" button is visible at the top right of the main content area.

**Delete:**

**click the delete button**
